

Validation of an Email ID Pseudo code:

Name: Pramod

1. Create an ArrayList to store email IDs called personEmails.
2. Add email IDs of employees to the personEmails ArrayList.
3. Create a function searchEmailID that takes two parameters:  
    ArrayList of Strings emailList  
    String searchEmail
4. Inside the searchEmailID function:  
    Iterate through each email in emailList  
    For each email in emailList  
    Check if the email matches searchEmail  
    If there is a match return true to indicate the email was found.  
    c. If no match is found after the loop, return false to indicate the email was not found.
5. In the main program  
    Create a Scanner object to read user input.  
    Prompt the user to enter the email ID to search.  
    Read the users input and store it in a variable searchEmail.  
    Call the searchEmailID function with personEmails and searchEmail as arguments.  
    Check the result returned by searchEmailID and display an appropriate message:  
    If true is returned display searchEmail is in the list  
    If false is returned display searchEmail is not in the list
6. Close the Scanner
7. End of the program.
